# Detecting and quantifying variants

Mark Stenglein

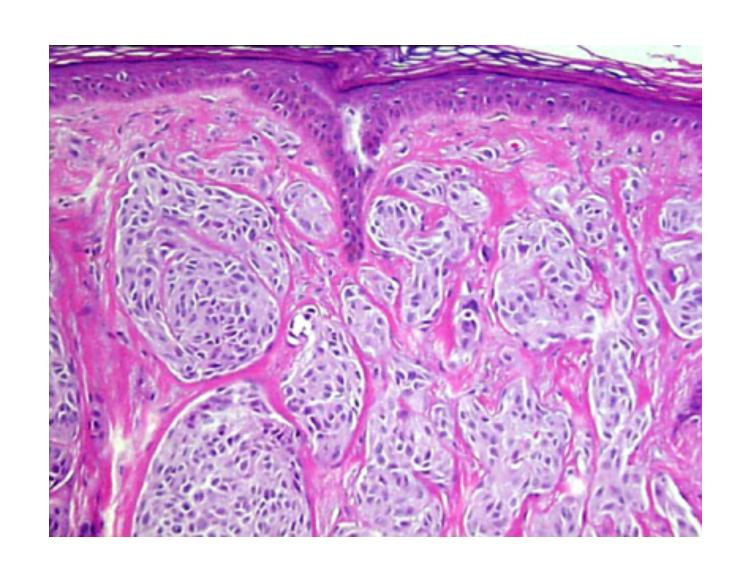

SMBE Regional Workshop on Computational Biology in Todos Santos, Mexico

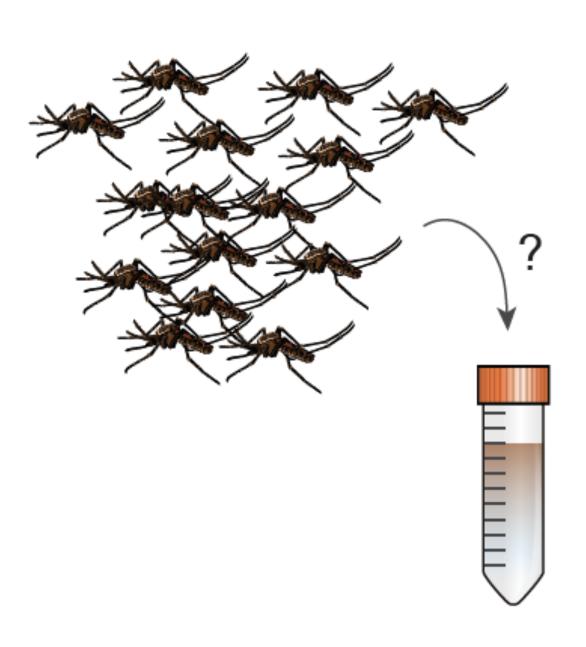

# Genomic variation is important in a variety of contexts

Rare somatic variants in cancer (cancer subclones)

Population genomics using pools of individuals (Pool-Seq)

Intrahost viral variation

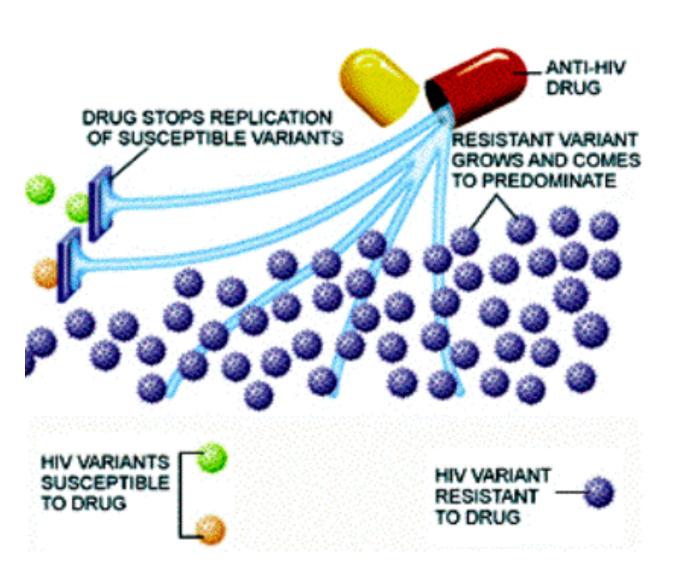

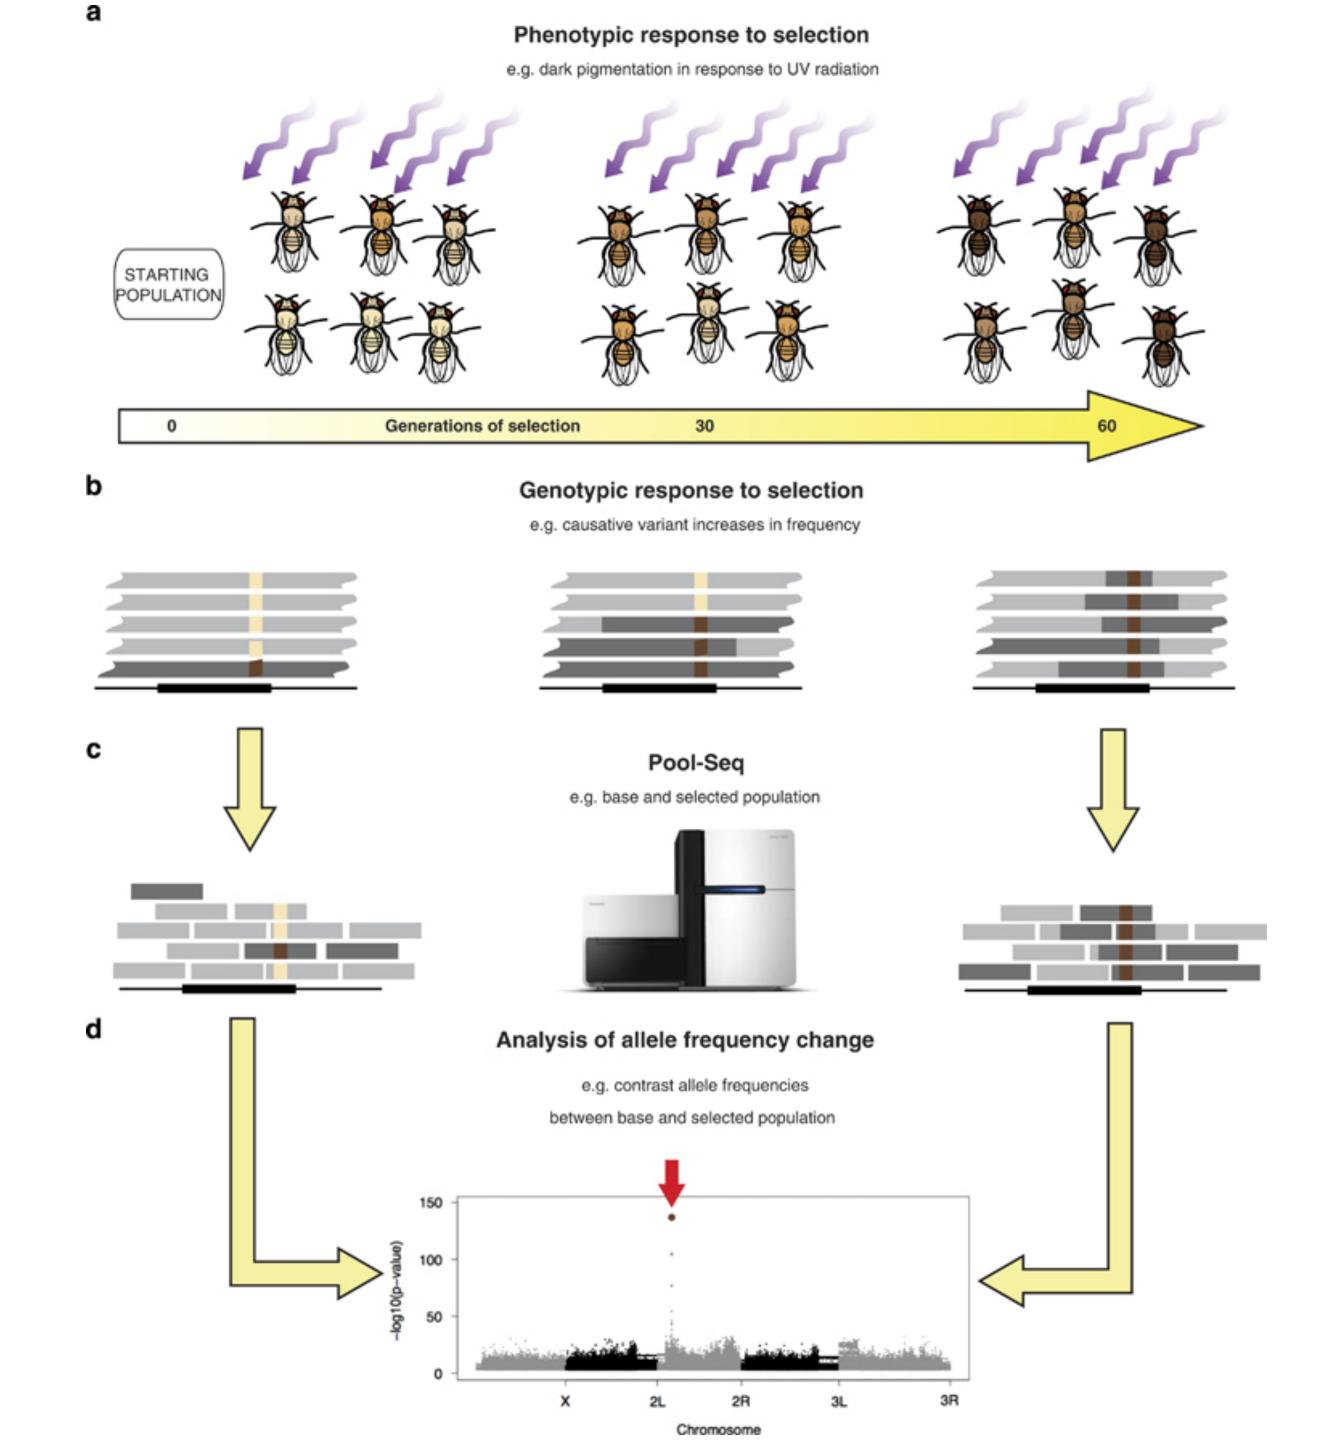

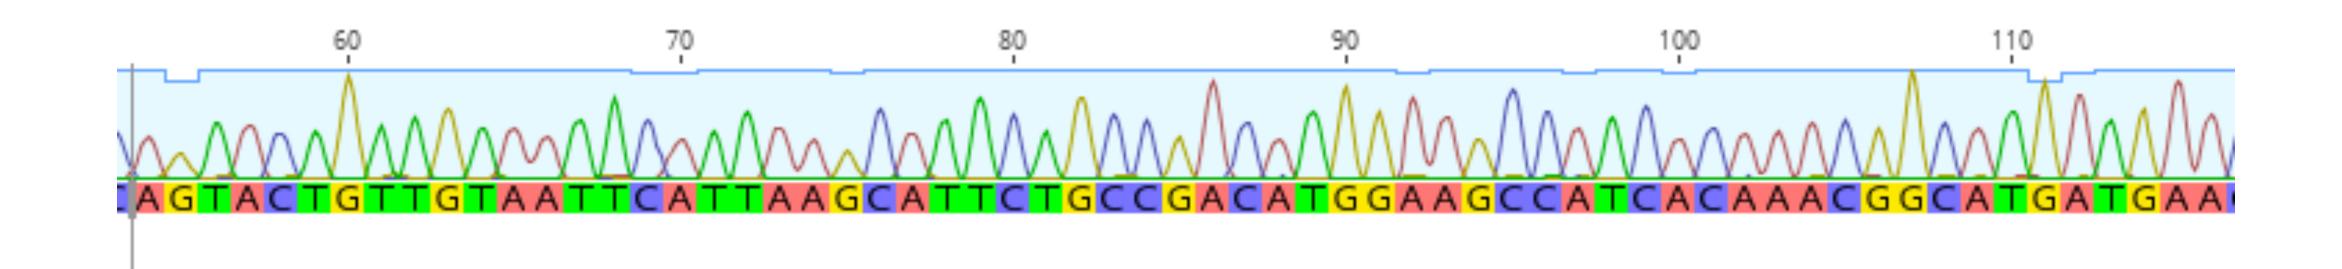

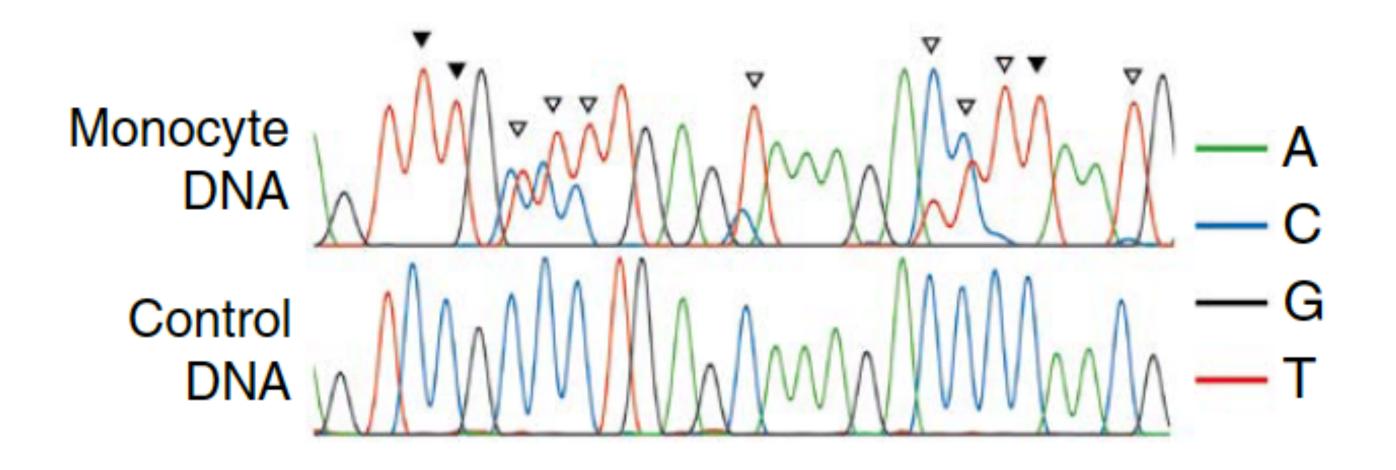

image: Magro et al (2006) Modern Path.

"Evolve & Resequence"

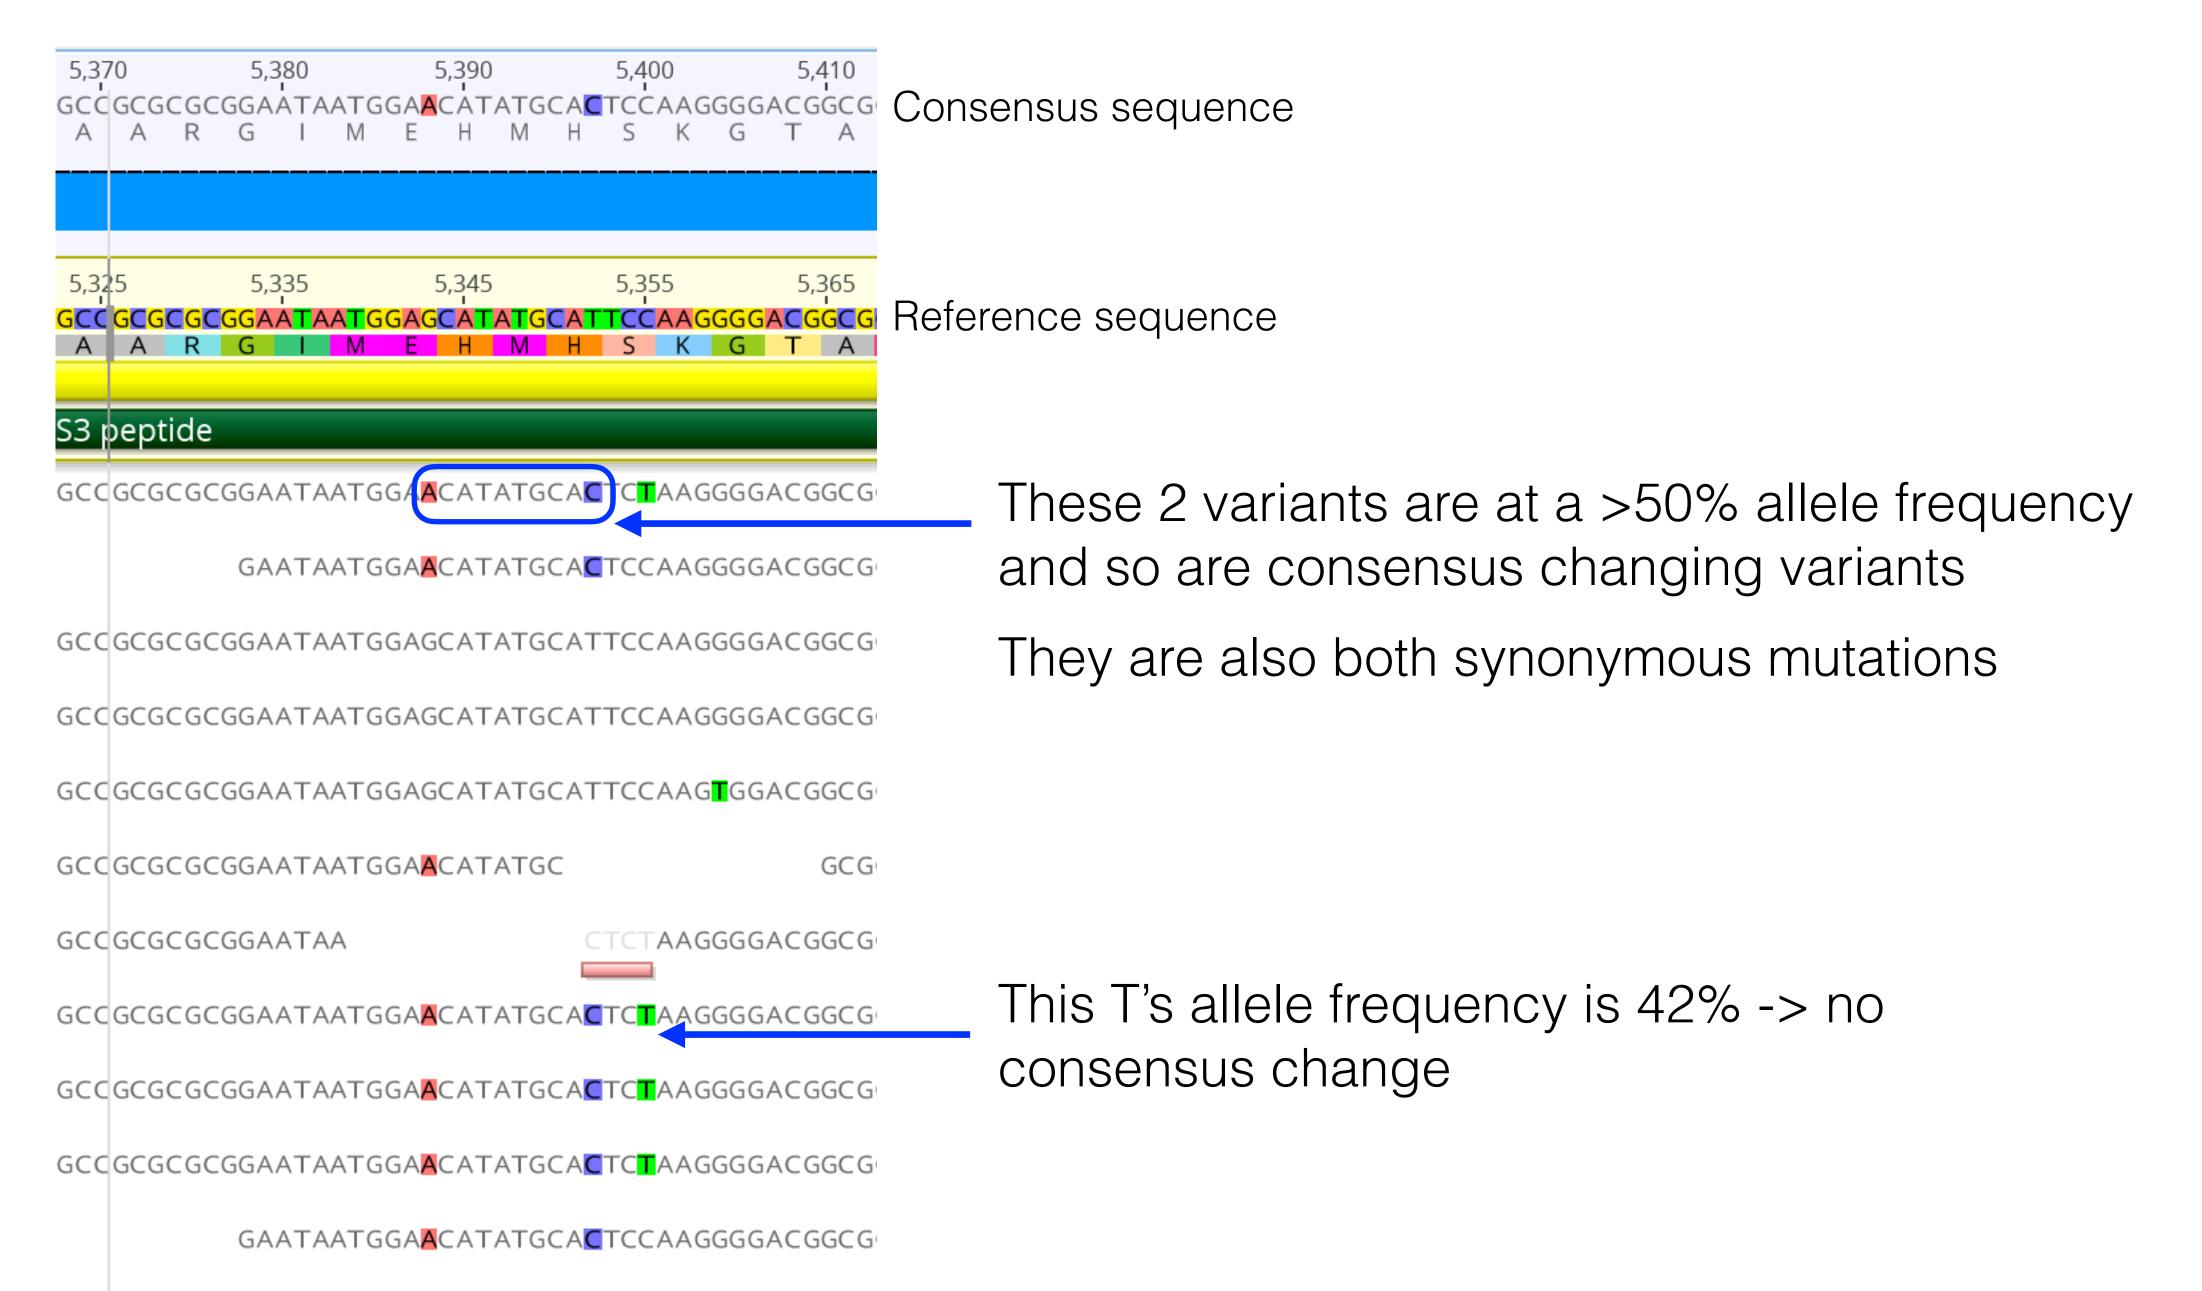

# Sanger sequencing typically produces consensus sequence

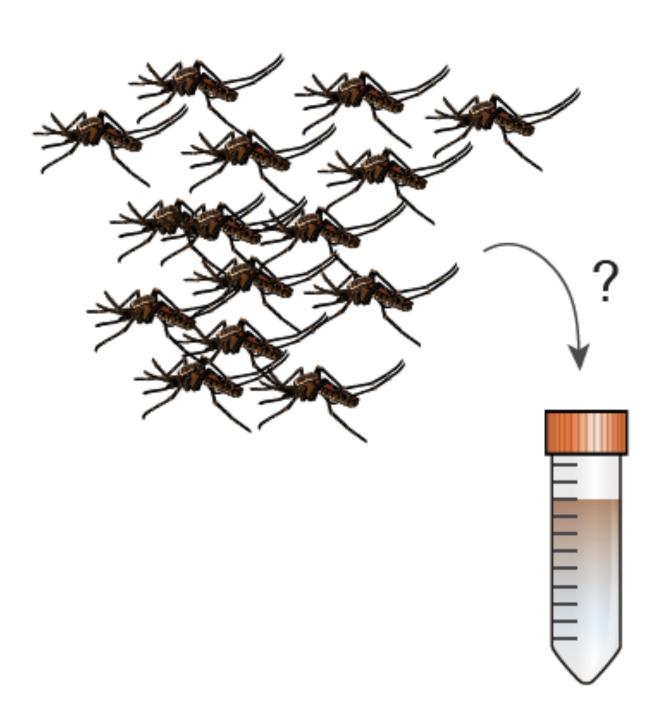

It is possible to analyze chromatograms to obtain variant frequencies

## Goal: identify variants, their frequencies, and potential functional impact

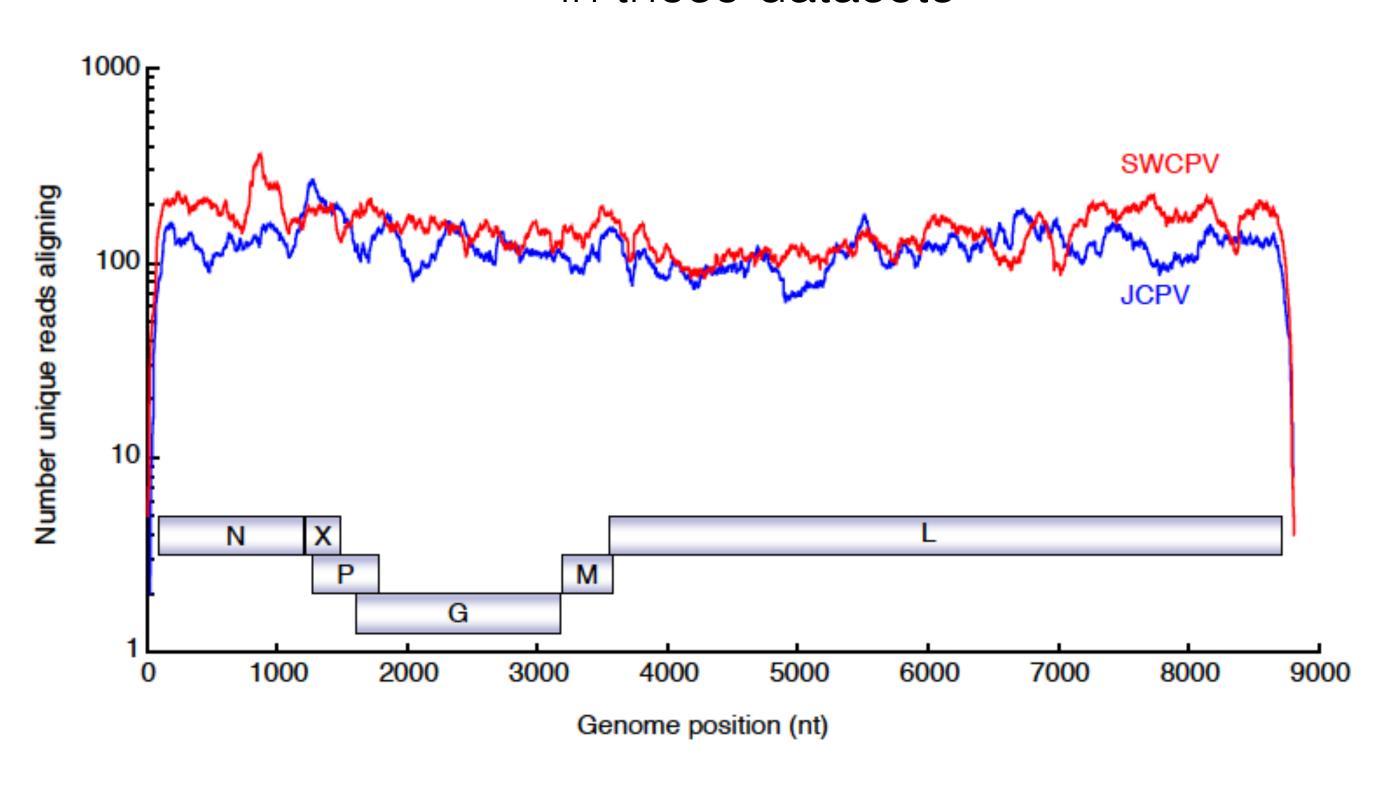

#### Biological and technical limitations to the ability to detect rare variants

Pool size could limit the ability to detect rare variants

about 100x average coverage: unlikely to observe variants with frequency < 1% in these datasets

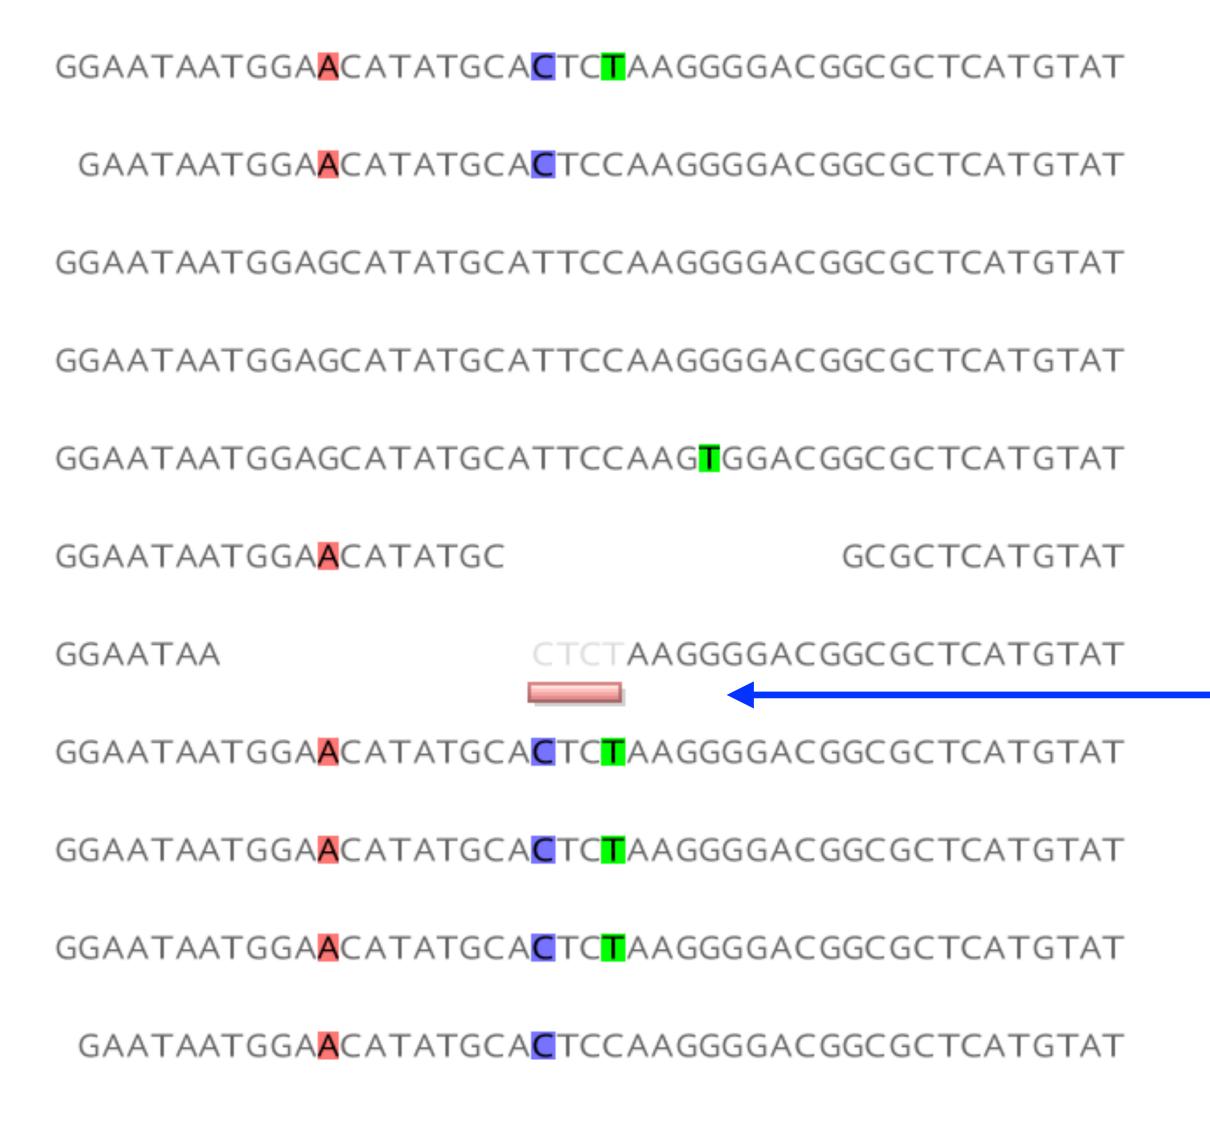

#### Distinguishing sequencing errors from true rare variants can be a challenge

GGAATAATGGAACATATGCACTCTAAAGGGGACGGCGCTCATGTAT GAATAATGGAACATATGCACTCCAAGGGGACGGCGCTCATGTAT GGAATAATGGAGCATATGCATTCCAAGGGGACGGCGCTCATGTAT GGAATAATGGAGCATATGCATTCCAAGGGGACGGCGCTCATGTAT GGAATAATGGAGCATATGCATTCCAAGTGGACGGCGCTCATGTAT GGAATAATGGAACATATGC GCGCTCATGTAT **GGAATAA** CTCTAAGGGGACGGCGCTCATGTAT GGAATAATGGAACATATGCACTCTAAAGGGGACGGCGCTCATGTAT GGAATAATGGAACATATGCACTCTAAAGGGGACGGCGCTCATGTAT GGAATAATGGAACATATGCACTCTAAGGGGACGGCGCTCATGTAT GAATAATGGAACATATGCACTCCAAGGGGACGGCGCTCATGTAT

sequencing error, or real low frequency variant?

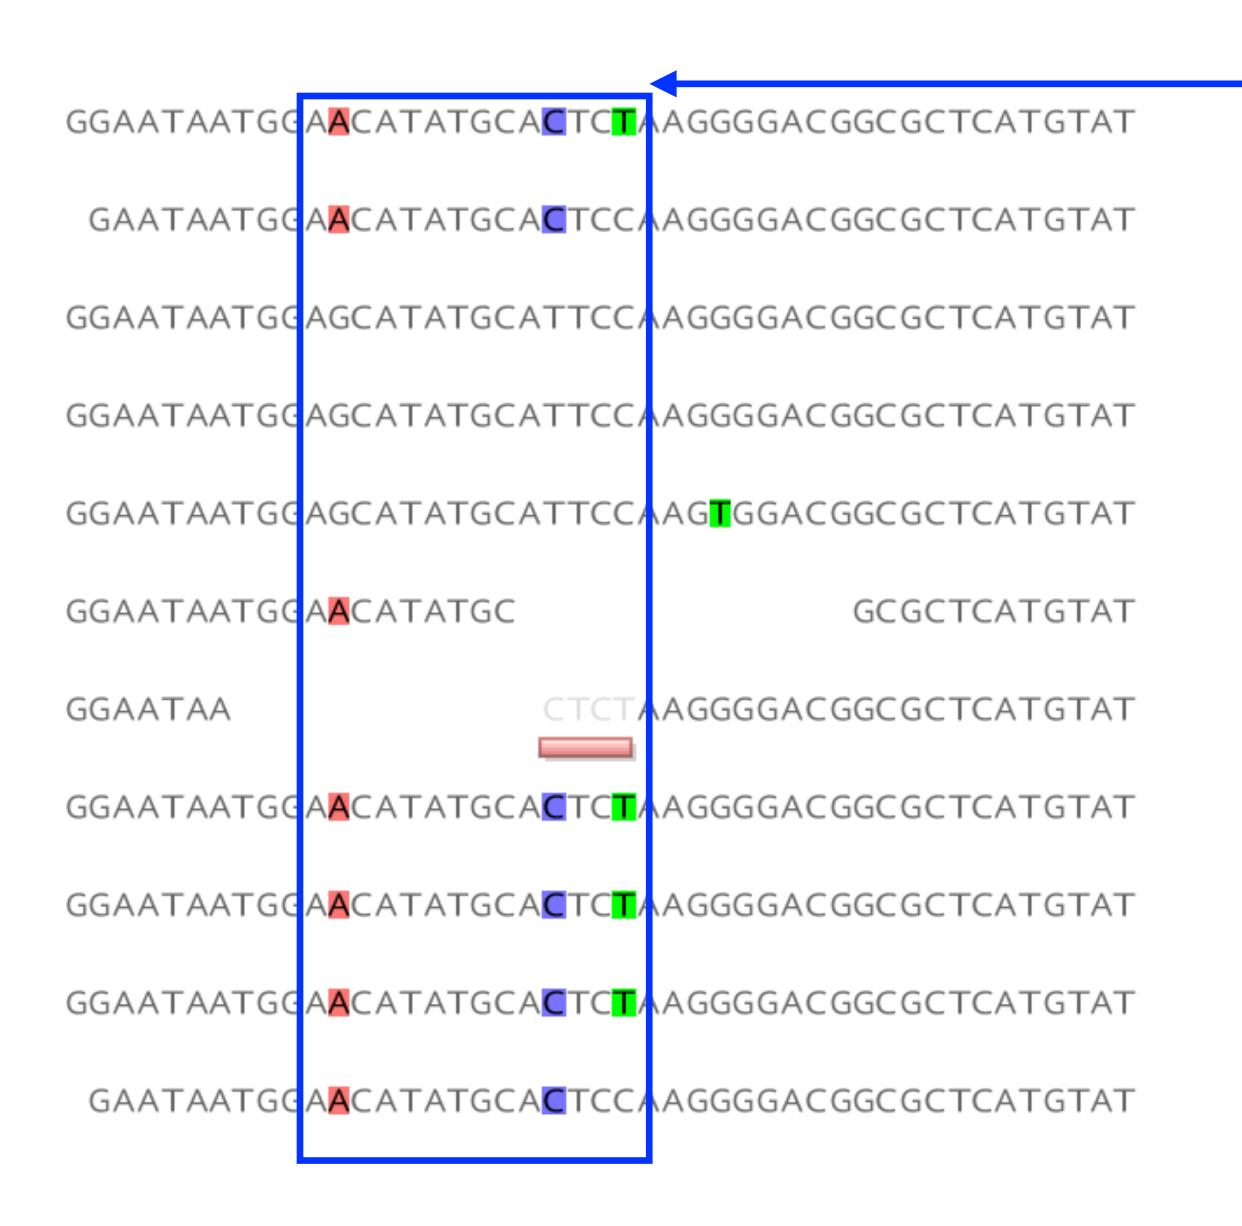

#### Variant calling is also sensitive to mapping

These bases were soft-trimmed (not aligned), but they support variant basecalls

Different mapping software could well produce different results.

#### Another issue is linking or 'phasing' variants (haplotype reconstruction)

3 haplotypes evident here

GTC [reference sequence]

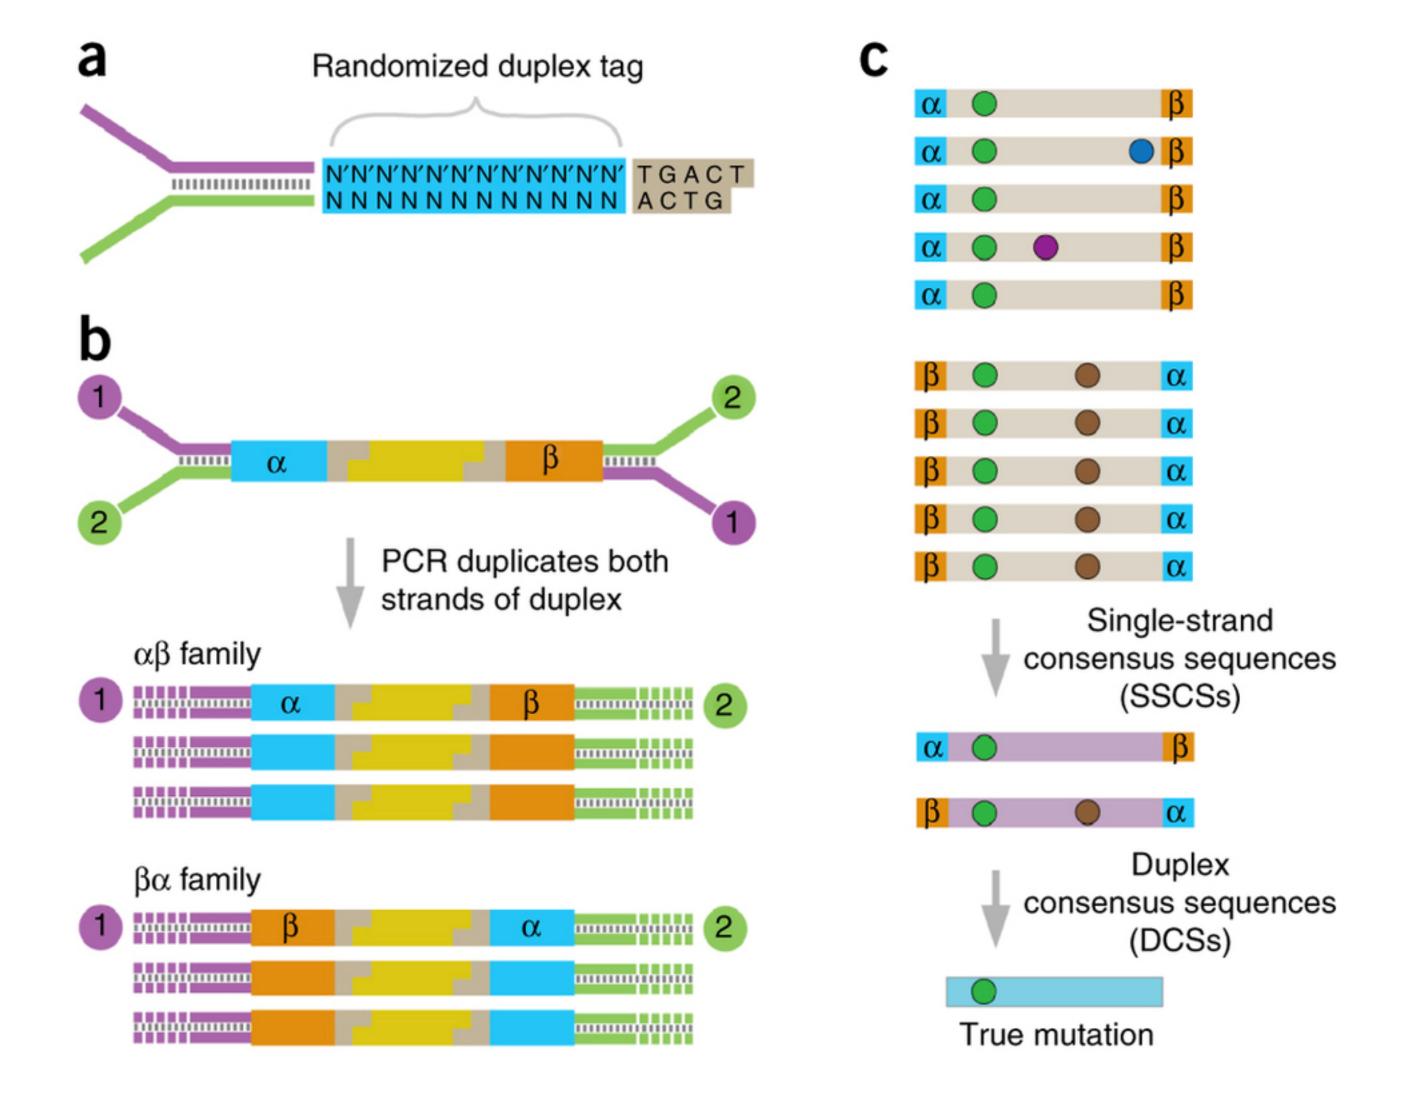

ACC [2 mutations]

ACT [3 mutations]

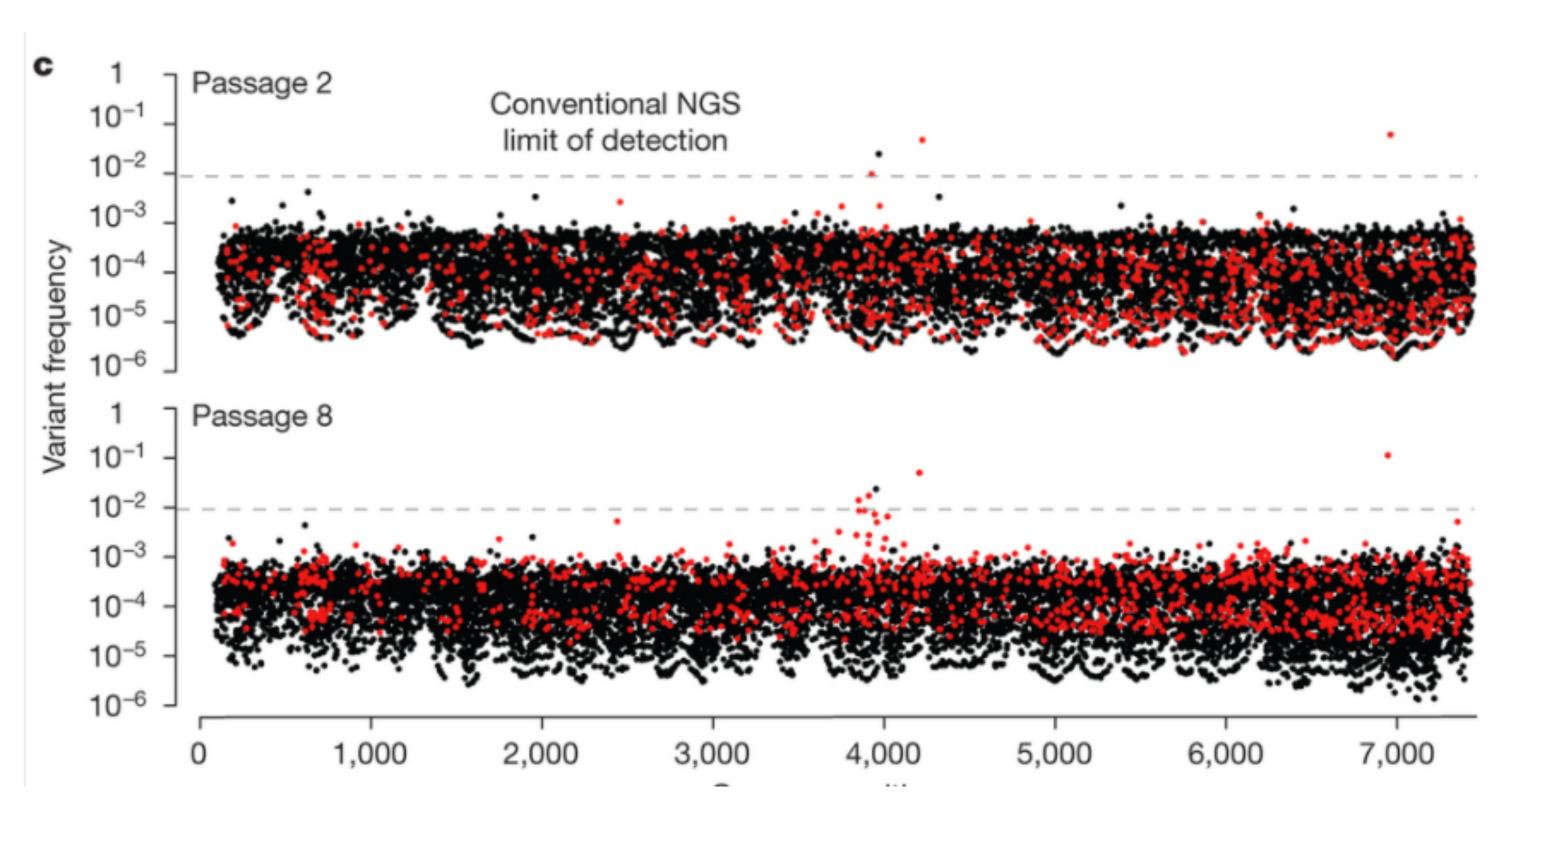

Hard to link distant variants using short read data

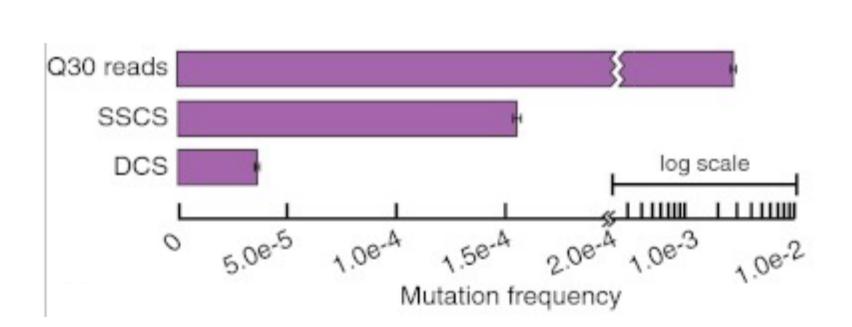

Several clever methods have been developed to get beyond the limit of detection due to sequencing errors

Some protocols take advantage of PCR duplicates to sequence the same original molecule multiple times

## These methods aim to decrease variant frequency limit of detection

# These approaches have practical limitations

That's a lot of (poly-A) RNA

according to the manufacturer guidelines. Then 2–5µg of poly(A)-containing RNA was fragmented with fragmentation reagent (Ambion) for 7.5min at 70°C. A practical minimum for this library preparation is 1µg to ensure that enough fragmented RNA is obtained to produce a library with sufficient complexity and handle reproducibly. Approximately 80–90-base RNA fragments

#### The good news!

You don't necessarily or even often need linked variants or ultra low frequency variants to infer population genetic parameters (or otherwise answer your question of interest)

# A typical workflow for variant identification

```
Sample: DNA/RNA isolation
          Library prep / sequencing
Mapping to a reference genome or an assembly
                Variant calling
       Downstream analysis of variants
```

#### The standard format for variant data is the vcf file (variant call format)

```
##fileformat=VCFv4.3

#### A couple reviews to get you started

Schlötterer et al (2014) Nat Rev Gen doi:10.1038/nrg3803

Posada-Cespedes et al (2016) Virus Res doi:10.1016/j.virusres.2016.09.016

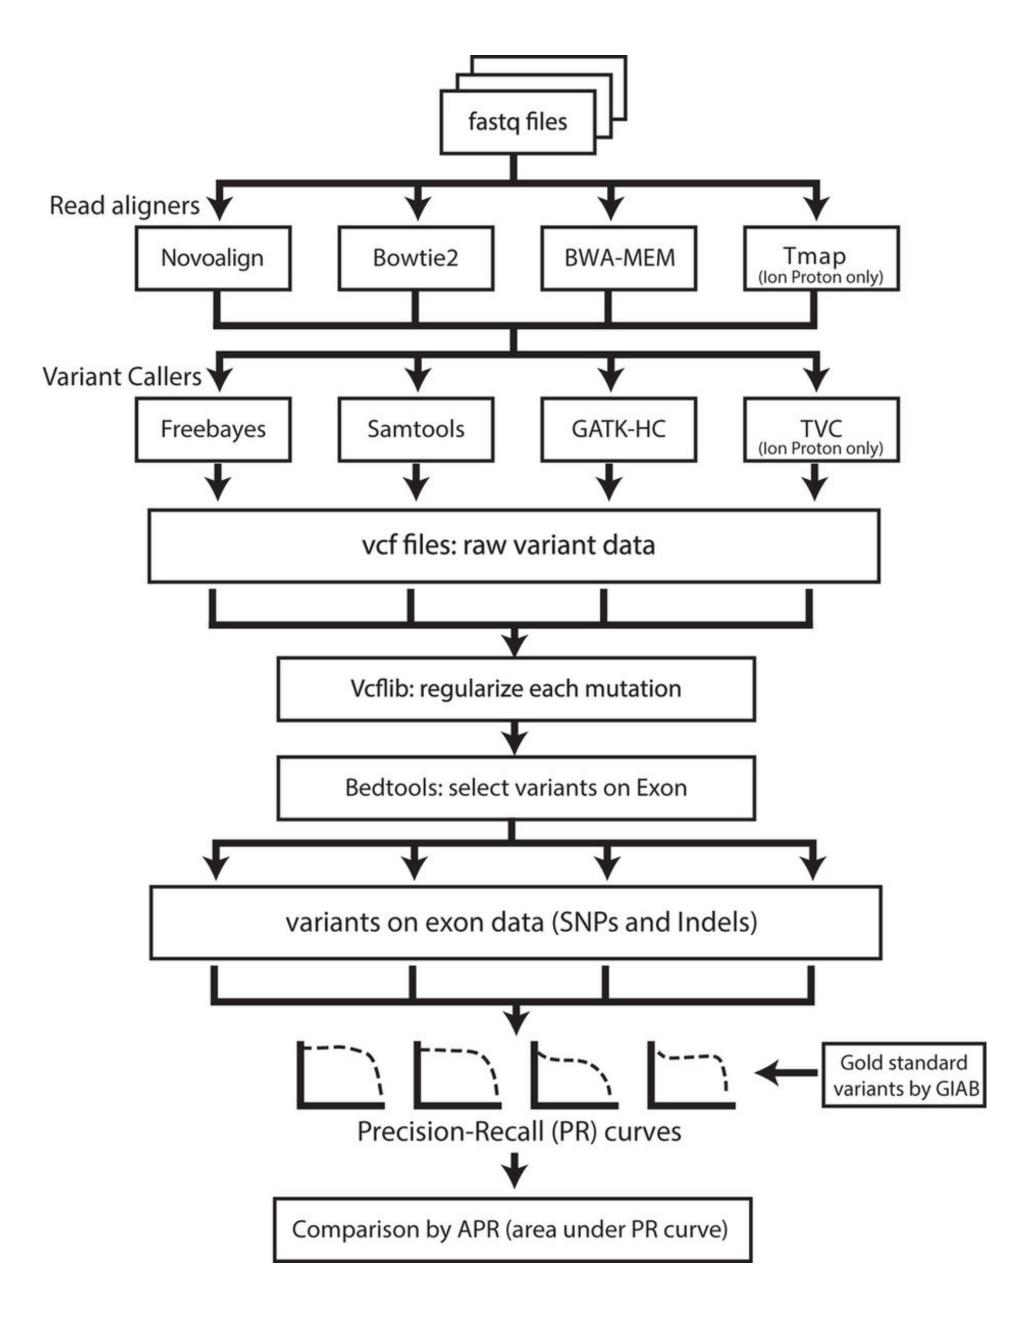

Table 2   <b>To pool or not to pool?</b>		
Scenario	Pool-seq recommended?	
Small sample size (<40 individuals)	Yes, but only appropriate when carried out on genomic windows containing multiple SNPs instead of on individual SNPs	
Phenotypes of individuals are or will be available	RAD-seq of individuals is probably better suited for many cases	
Linkage disequilibrium is key to data analysis	RAD-seq of individuals is probably better suited for many cases	
High confidence about low-frequency SNPs is needed	Not with current protocols; sequencing of individuals is preferred	
Simple population genetic analyses, such as population differentiation or average heterozygosity	Yes, but when coverage is low it results in a lower confidence of the allele frequency estimate of individual SNPs	
Identification of selective sweeps	Yes, but only limited information about linkage disequilibrium can be obtained	
Time series with large sample sizes and many replicates	Yes	
Mapping of induced mutations	Yes, identification of the causative site is possible	
GWAS	Yes, provided that replicates and large pool sizes are available, but other approaches should also be considered	
QTL mapping	Yes, but no effect sizes are estimated	
Intraspecific polymorphism of bacterial and viral populations	Yes	
Information about dominance and effect size is important	No	
Cancer	Pool-seq is a natural approach to analyse the cell population	
GWAS, genome-wide association study; QTL,	quantitative trait locus; RAD-seq, restriction-	

site-associated DNA sequencing; SNP, single-nucleotide polymorphism.

## These reviews summarize relevant software, pitfalls, best practices, etc.

Population genetics		
<u>PoPoolation</u>	Estimates variation within populations	39
PoPoolation2	Estimates differentiation between multiple populations	132
Pool-HMM	Detects selective sweeps from the allele frequency spectrum using a hidden Markov model	133
npstat	Computes a wide range of population genetic estimators; may be used in conjunction with an external SNP caller; every contig needs to be analysed separately	134
<u>Stacks</u>	Developed for population genomics with RAD-seq; may also be used with pooled RAD-seq data	135
Bayenv2	Estimates differentiation between populations	79
<u>SelEstim</u>	Detects and measures selection	136
<u>KimTree</u>	Infers population histories	137

# Several papers fairly recently compared variant calling software

Hwang et al (2015) Sci Rep DOI: 10.1038/srep17875

# Fairly good overlap from different pipelines using Illumina data

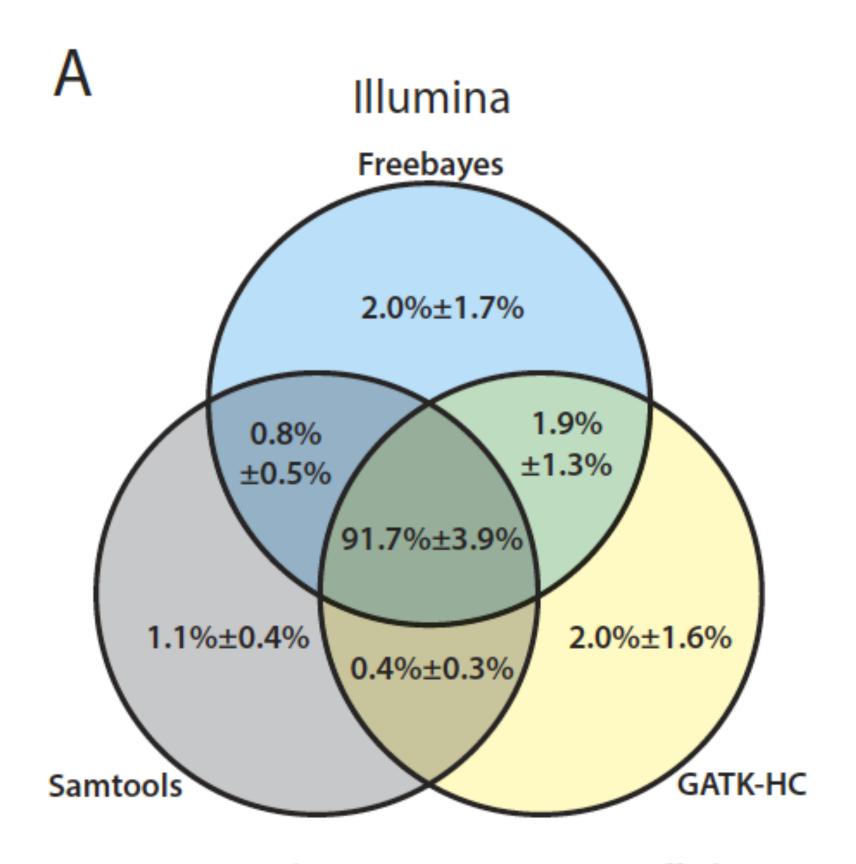

Figure 3. Venn diagrams summarizing called variants

#### Let's call some variants!
